# Creating a GitHub pages link!

In this short doc, we will walk you through the simple process of creating your very own github account, and uploading your project to create a unique link to review your project online.

1. Go to www.github.com and create an account.
2. Go to "your repositories"
3. Click "new"

4. Set up the repository name and select the "**Initialize this repository with a README**" check-box
5. Press "create repository".

6. You have now reached this point:
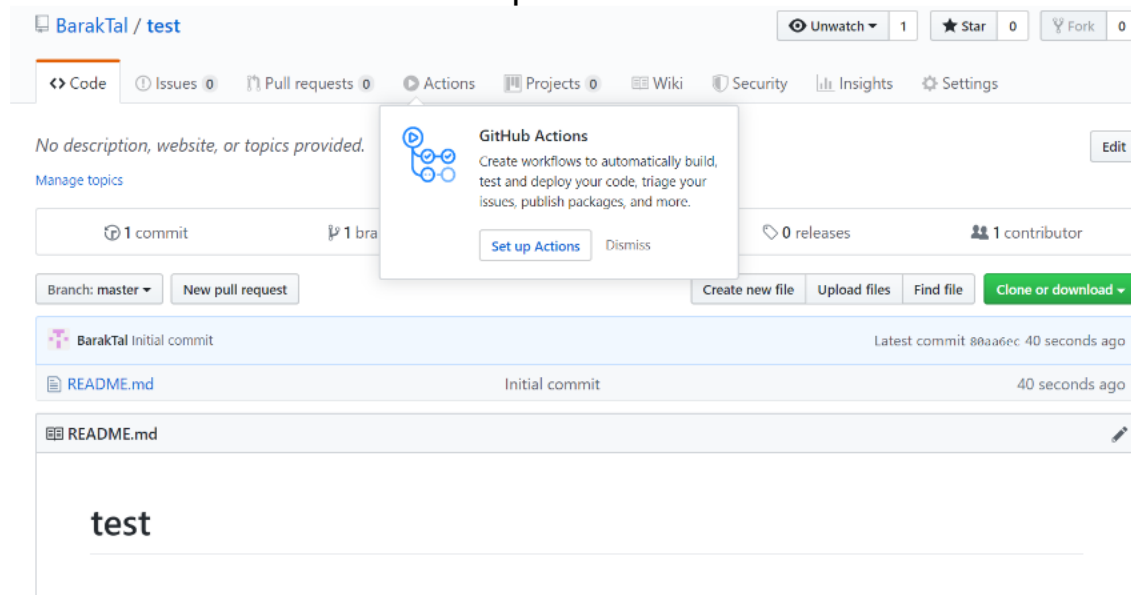

7. Drag and drop your project files into this page. Pay attention: drag the files from inside your folder like in the picture, <mark>not the whole project folder!</mark>

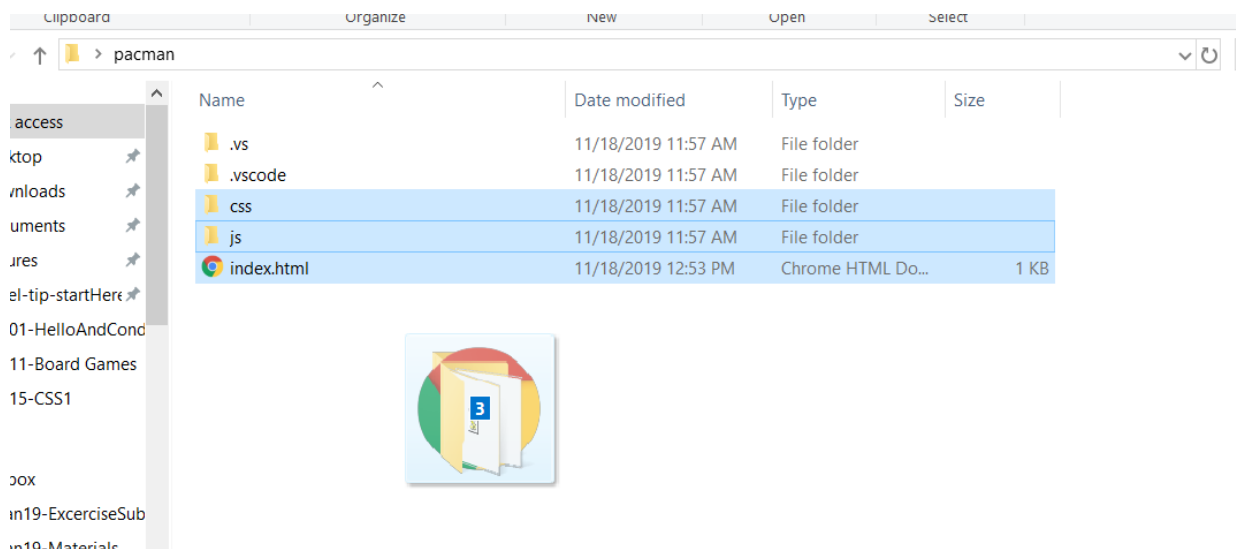

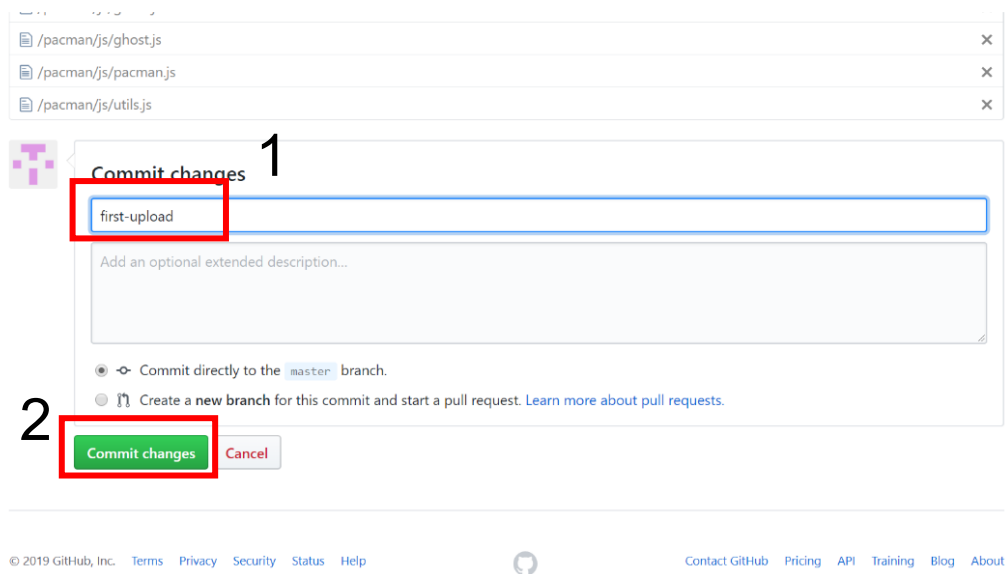

Important!!!
Make sure that the paths start with the folder name and not with a '/'

```html
<!-- NOT LIKE THIS -->
<script src="/js/game.js"></script>

<!-- LIKE THIS -->
<script src="js/game.js"></script>
```
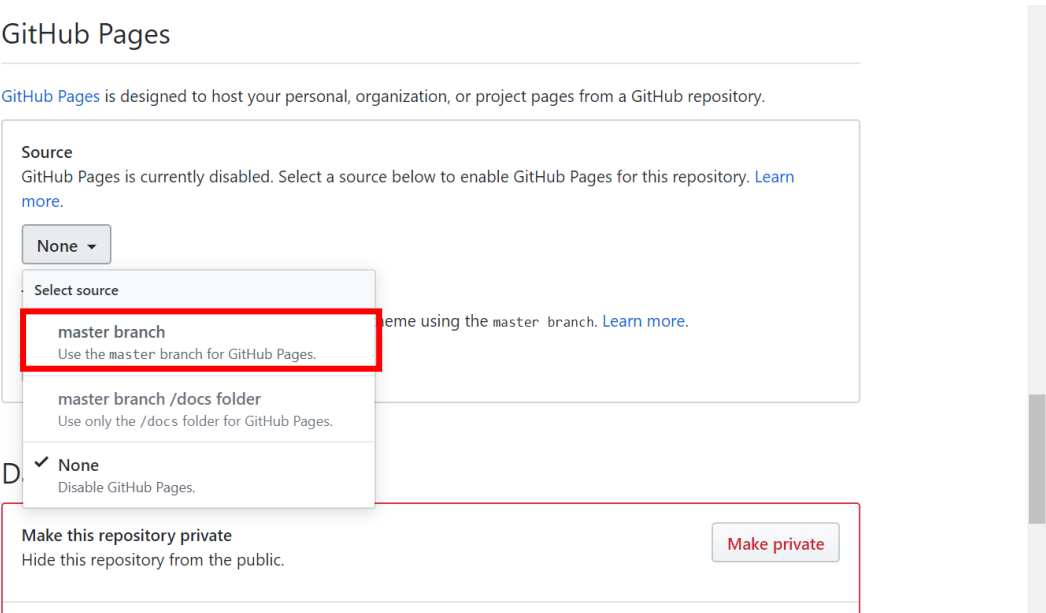

8. Write something in the commit changes box and press "commit changes"

9. Go to "settings" in your repository

10. Under "GitHub pages" select the source select button to show "master-branch".

11. After doing that, your page will refresh. Go back to the "GitHub pages" section, and see that you now have a link for your project.

12. Click the link and enjoy your website (sometimes will take a few minuets to work..)

13. Send your link to your friends and family, show off your amazing achievement!
